DESCRIBE THE PRESENT AND ORIGINAL (If known) PHYSICAL APPEARANCE

Bollinger Mill is a four-story, water-powered, horizontal grist mill, now under restoration by the Missouri State Park Board. Its "under-house, through which the Whitewater River flows to actuate the mill's two turbines, and its first floor are constructed of squared rubble masonry, while its upper stories are constructed of brick laid according to the common bond method. The mill has a wood frame, gambrel roof covered with standing seam metal roofing.

EXTERIOR

The main elevation has a central recessed door flanked by two windows, one to each side, at each story, with a single central window in the gable. The first floor door and windows have stone slipsills and lintels. The upper story doors have stone lugsills and segmental arches with radiating brick voussoirs, while the windows have brick lugsills, segmental arches, and radiating voussoirs. The face of the first story is covered by an open wooden porch with a metal, standing seam roof. Most of the window openings are closed with wood or metal shutters, but, when restoration is complete, they will hold six-over-six light, double-hung sashes.

The headrace elevation, which terminates in a row of brick dentils, has four evenly spaced windows with stone lugsills and lintels on the first floor, and five evenly spaced windows with brick lugsills, segmental arches, and radiating voussoirs on the upper floors. The "under-house" has three iron barred windows in its upper portion with a twelve foot wide arched headrace opening below. A stone retaining wall is set at an angle before the headrace with a wooden grating fitted across the opening to prevent floating weeds and debris from choking the runners and tirls of the turbines.

The opposing tailrace elevation is almost identical in design to the headrace elevation excepting the presence of two tailrace openings, an eight foot wide arch at the same height as the headrace opening, and a smaller, six foot opening to the east of it and below the normal water level.

The rear elevation has three evenly spaced windows at the first three levels, two at the fourth level, and one centered in the gable. They are identical in type to the windows of the other elevations. Two centrally located windows also exist in the "under-house," with a third opening to the north over the retaining wall. Projecting out from this end of the building is the stone mill dam.

BOLLINGER MILL

INTERIOR

The interior of the "under-house" contains a crawl space to the west and the water passage and two inward flow turbines, one located by each tailrace opening, to the east. The shafts of the turbines run into the mill proper, the "meal-house," through an opening in the southeast corner of the first floor.

The interior of the upper portion of the mill, the "meal-house," is divided into four stories, each story containing one large open room with oak floors. Various milling machinery is randomly distributed throughout the building. The first floor, where the finished meal was originally distributed to the customers, contains several grain shutes and some small storage bins. The second floor contains more bins, a miller's bench, and two pairs of buhr millstones, one pair located in the center of the floor and the other situated in the southwest corner. The third story contains the greatest number of storage bins, and the fourth, or loft floor, contains the largest concentration of machinery, such as conveyors, conveyor shutes, hoppers, sifters and dusters.

Human circulation through the mill is provided by a series of four stairways located in each corner of the building. The southwest corner stair leads from the first floor to the crawl space approaching the "under-house," the southwest stair leads from the first floor to the second, and the northeast and northwest stairs lead on to the third and fourth floors.

STATEMENT OF SIGNIFICANCE

Bollinger Mill, rebuilt in 1867 at Burfordville in Cape Girardeau County, is historically significant as a 19th century, water-powered grist mill. Adjacent to the mill is one of Missouri's four covered bridges, the Burfordville Covered Bridge. This is the only mill and covered bridge complex left in Missouri.

For the past 172 years, a mill has occupied this mill site. George Frederick Bollinger, an immigrant from North Carolina, came to the area in the late 1700's where he operated an Indian trading post. (Marshall Dial, Librarian, New Madrid County Library, information in a letter to the Missouri State Historical Survey and Planning Office, April 28, 1971.) In 1797 the Spanish commandant of St. Louis granted Bollinger a large tract of land under the condition that he develop the land and bring settlers into the territory. Thus in 1799 a log grist mill accommodated the twenty North Carolinian families brought into the district by Bollinger. (History of Southeast Missouri, 1888, p. 276.)

In addition to serving in the first territorial legislature and being quite active in civic affairs, Bollinger operated the mill until the time of his death in 1842. For 43 years, under Bollinger's ownership, the mill had served pioneer settlers on the St. Francois, Black and Whitewater rivers. Some customers ventured from 75 to 100 miles to have their corn and wheat ground at the largest and finest mill in the region. In 1825 Bollinger had replaced the log structure and log dam with a stone foundation and frame structure. (Louis Houck, A History of Missouri, II, 1908, p. 182.)

8.

BOLLINGER MILL

The mill continued to operate under the ownership of Bollinger's son-in-law, Ralph Daugherty. The Daughertys sympathized with the South; during the Civil War their mill ground grain for the Confederacy. Union troops burned the mill and shelled the dam in 1864. (Dial, April 28, 1971.) Left unharmed was the covered bridge spanning the Whitewater River. Built ca. 1858, this bridge is a National Register site (70-5-24-0012) being significant as one of three covered bridges in Missouri employing the Howe truss in its construction.

The mill site with the old stone foundation remained unutilized until 1867 when S. R. Burford, for whom Burfordville is named, rebuilt the mill in 1867 adding three stories made of sun-dried brick and, in 1868, a gambrel roof. (The Bulletin of the Missouri Historical Society, VII, No. 2, 1951, p. 276.) Burford equipped the mill with four-foot French buhrstones which are still in operating position at the mill. Burford had operated the mill for 30 years when he sold the mill to the Cape County Milling Company which had been established in 1895 in nearby Jackson, Missouri.

This company purchased the mill in either 1899 or 1900. Corrugated steel rolls and a second water wheel were installed in 1912. The buhrstones remained in use. During this period, the daily capacity of the mill reached 250 cwts. (Dial, April 28, 1971) The company closed the plant in 1942 and in 1953, when the Cape County Milling Company became insolvent, the mill was dismantled.

Descendants of George F. Bollinger purchased the mill and donated it to the Cape Girardeau County Historical Society which has in turn donated it to the Missouri State Park Board. Presently, the Park Board is restoring the mill to operable condition as a grist mill. Much of the machinery remains in the mill such as the inward flow turbines on vertical shafts, the French buhrstones, conveyors and conveyor shutes, various types of sifters, dusters, and storage bins. (On site inspection by Priscilla A. Evans and Stanley B. Andrews, staff members, Missouri State Historical Survey and Planning Office, April 5, 1971.)
